With this paradigm it is possible to express static (e.g., arrays) or dynamic (e.g., event emitters) data streams with ease, and also communicate that an inferred dependency within the associated execution model exists, which facilitates the automatic propagation ... Introduction. ODB is an
object-relational mapping
(ORM) system for C++. It
provides tools, APIs, and
library support that allow
you to persist C++ objects
to a relational database
(RDBMS) without having
to deal with tables,
columns, or SQL and
without manually writing
any of the mapping code.
